# **Can Specific Problems**

#### **Problem**

#### Description

	Haze or off-flavor formation from
Scalping	Absorption of odorants by polymeric <b>liner</b> (possibly an issue for hop aroma/cannabis compounds)
Staling	Accelerated oxidation (if air in headspace; or, following <b>corrosion</b> and loss of hermetic seal)

Tainting

aluminum or other components following corrosion

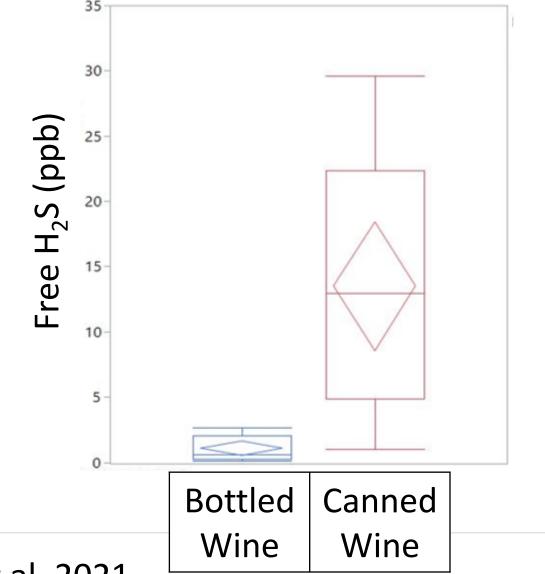

Cornell CALS

# Canned wines typically have higher H<sub>2</sub>S than glass

 Average H<sub>2</sub>S of canned wines (~13 ppb)

Cornell CALS

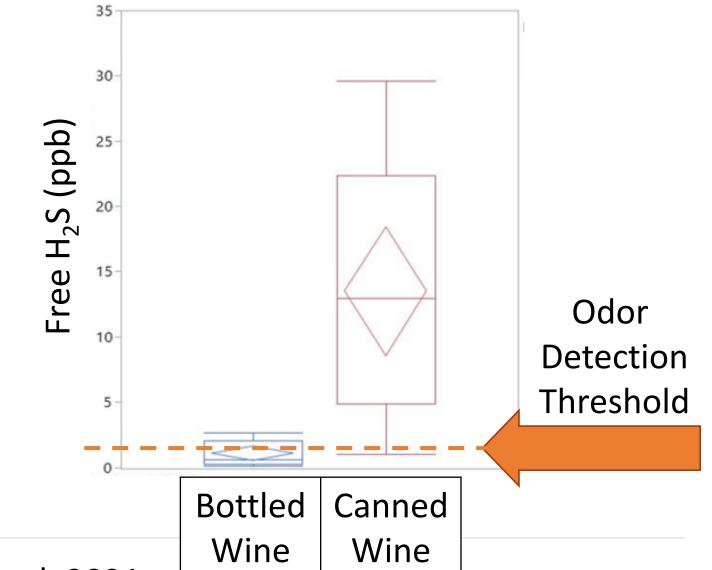

Allison et al, 2021.

# Canned wines typically have higher H<sub>2</sub>S than glass

 Average H<sub>2</sub>S of canned wines (~13 ppb)

Cornell CALS

 H<sub>2</sub>S odor detection threshold: 1.6 ppb (Siebert el al.)

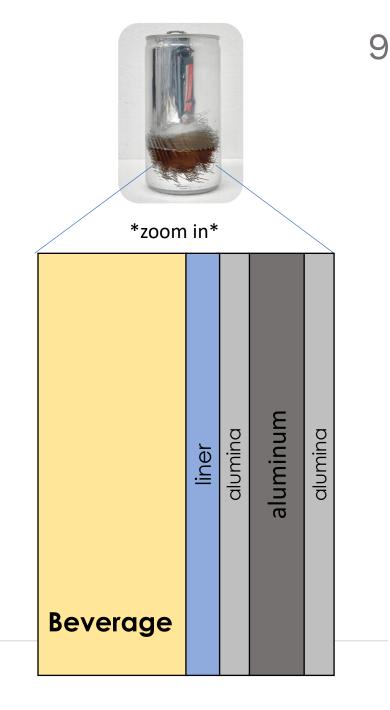

8

Allison et al, 2021.

# Anatomy of a can

• A can is basically a thin plastic bottle with an aluminum shell.

- Typical liners we have studied:
  - BPA-epoxy
  - BPA-NI alternatives
    - Acrylic
    - Polyester
    - BPF epoxy
    - aTULC

Cornel CALS College of Agriculture and Life Sciences

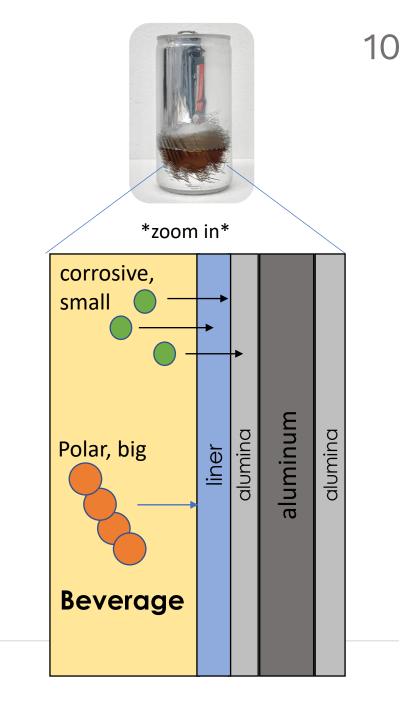

# Anatomy of a can

- A can is basically a thin plastic bottle with an aluminum shell.
- Two places to focus on corrosion:
   1) Liner x beverage interactions
   2) Aluminum x beverage interactions

# "How fast does a compound diffuse through the polymer?"

# "How do beverage components affect diffusion?"

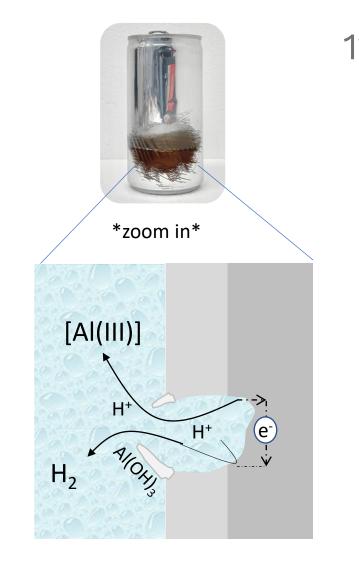

# Anatomy of a can

- A can is basically a thin plastic bottle with an aluminum shell.
- Two places to focus on corrosion:
  1) Liner x beverage interactions
  2) Aluminum x beverage interactions

"What reaction occurs between beverage components and aluminum?"

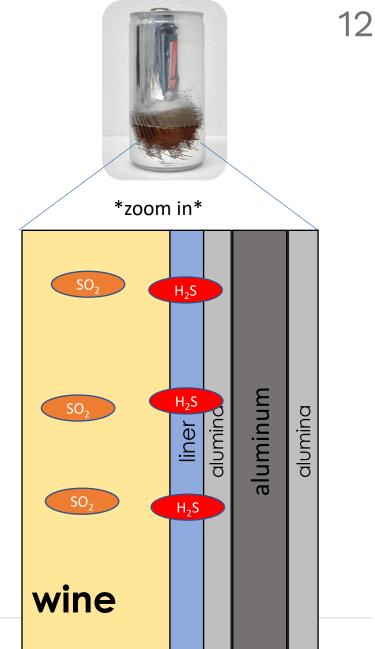

# "What can we measure to quantify this reaction?"

## H<sub>2</sub>S formation

Cornelicals College of Agriculture and Life Sciences

# H<sub>2</sub>S formation

Store @ 20 ° C

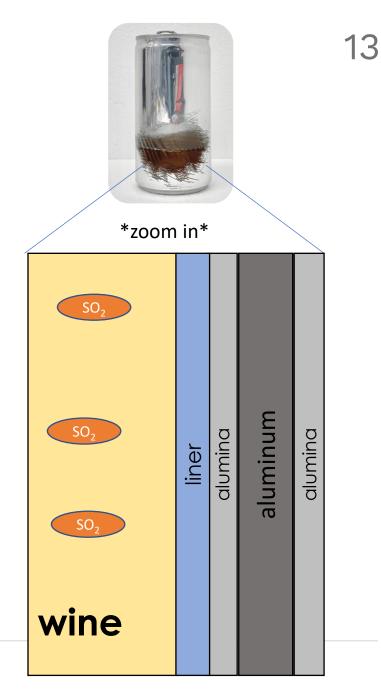

4-8 months

 $3AI_{(s)} + SO_{2(aq)} + 6H^+ \rightarrow 3AI^{3+}_{(aq)} + H_2S_{(aq)} + 2H_2O$ 

Or, SO<sub>2</sub> facilitates reduction of other sources of sulphur

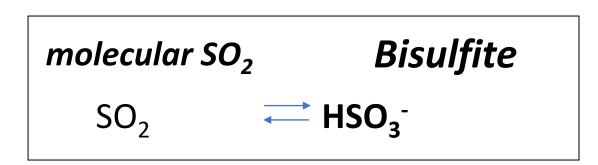

Cornelicals College of Agriculture and Life Sciences

Wine

#### **Review of SO<sub>2</sub> in wine: free vs.** molecular

"Free SO<sub>2</sub>" = molecular + bisulfite

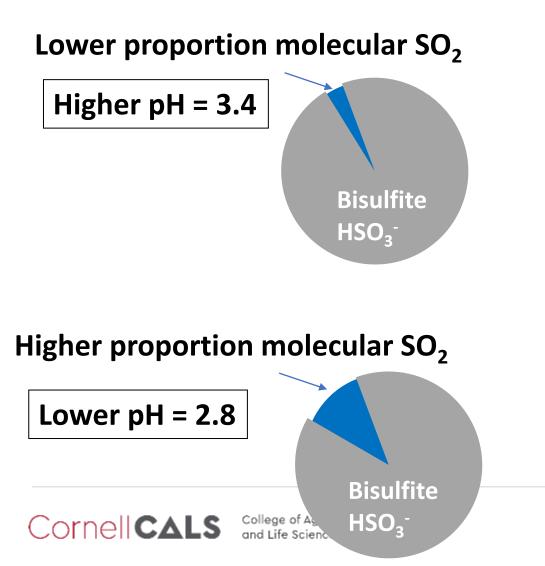

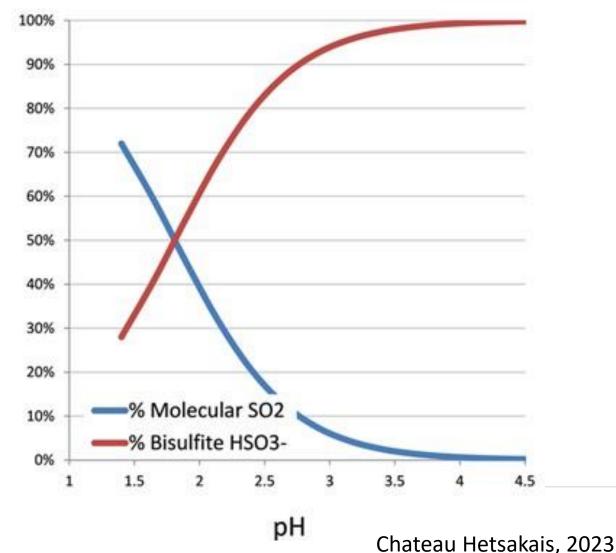

Ratio depends on pH

College of Agriculture and Life Sciences 14

#### Molecular SO<sub>2</sub> is a minor component of free SO<sub>2</sub>, typically <5%Higher molecular SO<sub>2</sub> proportions at lower pH

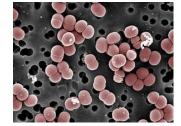

#### Review: we have two complementary targets with SO<sub>2</sub><sup>16</sup>

#### 1) Molecular SO<sub>2</sub> is an **antimicrobial**

Typically, ~0.6 mg/L molecular SO<sub>2</sub> recommended to prevent spoilage, with higher amounts recommended for wines with residual sugar At higher concentrations, concerns about sensory effects

#### 2) Free SO<sub>2</sub> (as bisulfite) is an **antioxidant**

~30 mg/L free SO<sub>2</sub> common recommendation for glass packaging Reacts with oxidation products (e.g. hydrogen peroxide, quinones) Typically, at <10 mg/L free SO<sub>2</sub>, oxidized aromas appear

#### SO<sub>2</sub> should be limited in cans

1) Molecular SO<sub>2</sub> is an **antimicrobial** 

# -> Currently not a better option for microbial stability at the same price point. In-Bulk HPP and velcorin are options

-> Cans hermetic seal eliminate the need for oxygen control in canned wines.

#### **SO<sub>2</sub> should be limited in cans**

1) Molecular SO<sub>2</sub> is an **antimicrobial** 

-> Currently not a better option for microbial stability at the same price point. In-Bulk HPP and velcorin are options

2) Free SO<sub>2</sub> (as bisulfite) is an **antioxidant** 

-> Cans hermetic seal eliminate the need for oxygen control in canned wines.

#### Review: we have two complementary targets with SO<sub>2</sub> 19

#### 1) Molecular SO<sub>2</sub> is an **antimicrobial**

Typically, ~0.6 mg/L molecular SO<sub>2</sub> recommended to prevent spoilage, with higher amounts recommended for wines with residual sugar At higher concentrations, concerns about sensory effects

#### 2) Free SO<sub>2</sub> (as bisulfite) is an **antioxidant**

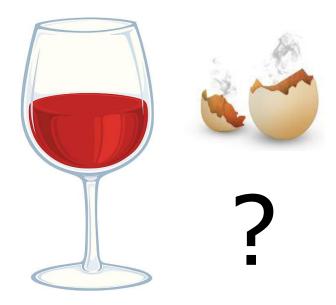

~30 mg/L free SO<sub>2</sub> common recommendation for glass packaging Reacts with oxidation products (e.g. hydrogen peroxide, quinones) Typically, at <10 mg/L free SO<sub>2</sub>, oxidized aromas appear

# What factors affect H<sub>2</sub>S production?

# Do any wine components predict H<sub>2</sub>S production?

How does liner choice affect H<sub>2</sub>S production following storage?

Cornelicals College of Agriculture and Life Sciences

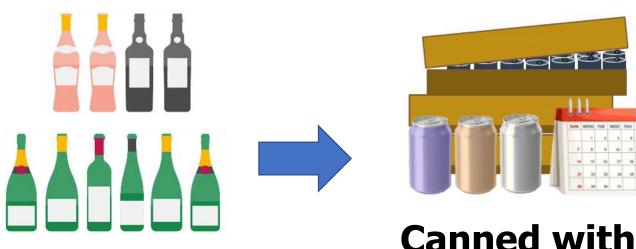

### **Experimental design**

#### 10 wines (2 rosés, 2 reds, 6 whites)

### **Experimental design**

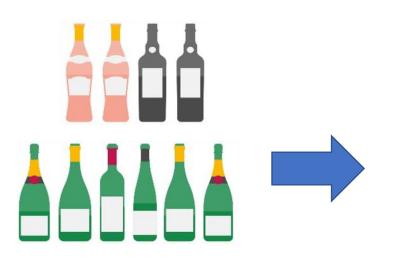

10 wines (2 rosés, 2 reds, 6 whites)

- Canned with.. N = 3 Liners N = 4 Timepoints
- N = 3 Replicates

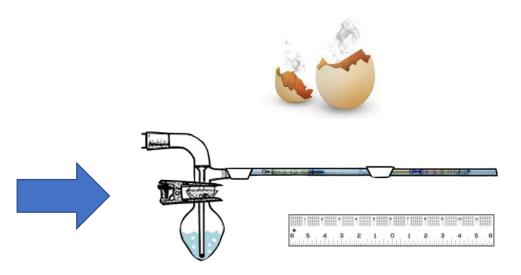

### **Experimental design**

10 wines (2 rosés, 2 reds, 6 whites)

Canned with.. N = 3 Liners

- N = 4 Timepoints
  - N = 3 Replicates

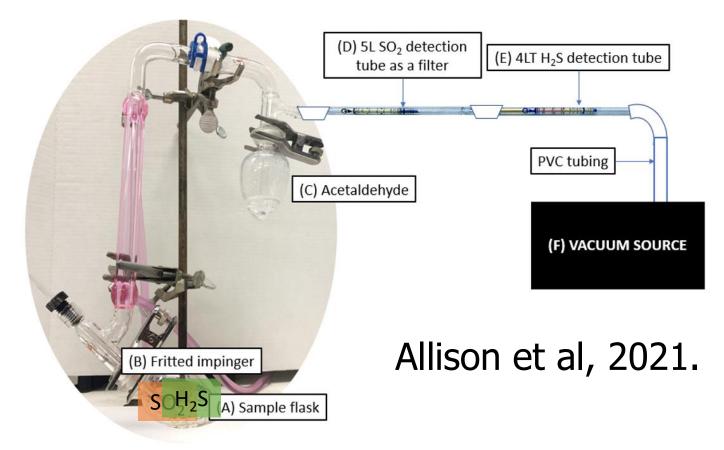

Measure H<sub>2</sub>S Visible degradation Measure Al<sup>3+</sup>

# Measuring H<sub>2</sub>S with gas detection tubes

• Wineries can adapt A-O setup to measure  $H_2S < 10$ minutes

 Excellent reproducibility within standard solutions

# Effect of liner type – long term aging

• Acrylic is not a suitable liner for wine.

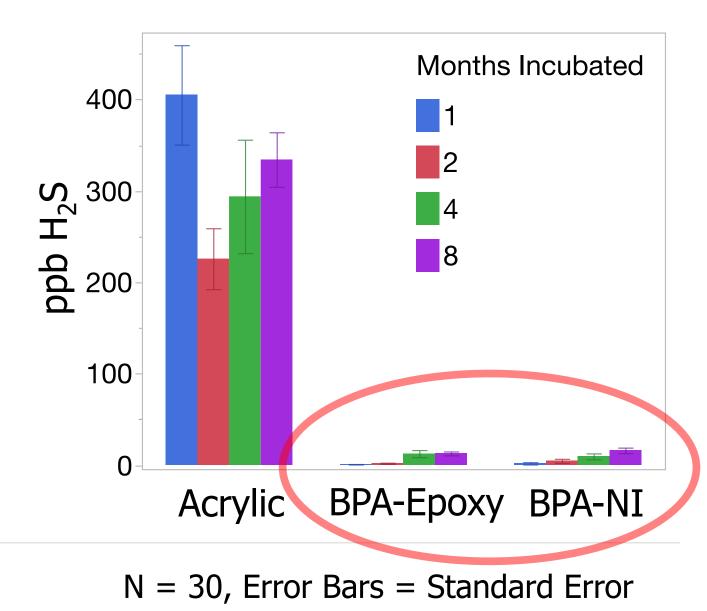

N = 30, Error Bars = Standard Error

# Effect of liner type – long term aging

• Acrylic is not a suitable liner for wine.

• BPA epoxy and BPA-NI perform comparably.

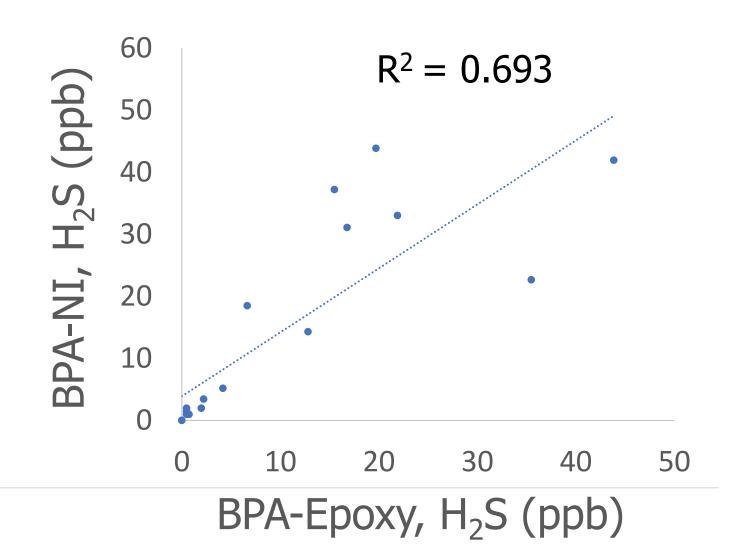

26

### Effect of liner type – long term aging

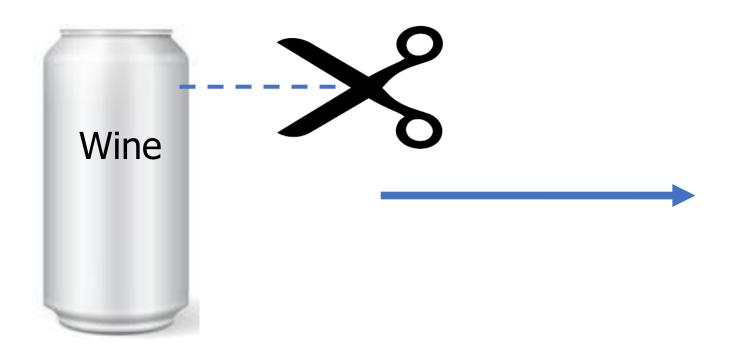

• Acrylic is not a suitable liner for wine.

• BPA epoxy and BPA-NI perform comparably.

# Visible degradation correlates to H<sub>2</sub>S production

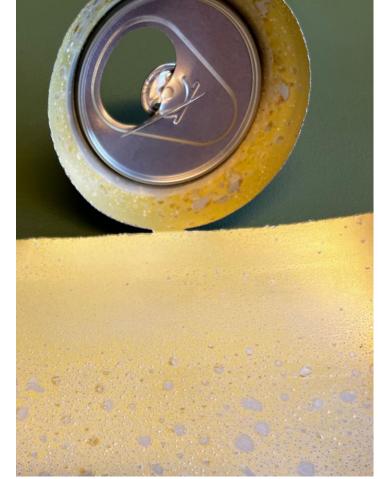

BPA/BPA-NI No H<sub>2</sub>S Production

CornellCALS College of Agriculture and Life Sciences

# Visible degradation correlates to H<sub>2</sub>S production

• Acrylic looked... scary.

#### Acrylic High H<sub>2</sub>S Producer

BPA/BPA-NI No H<sub>2</sub>S Production

# Visible degradation correlates to H<sub>2</sub>S production

• Acrylic looked... scary

 BPA/BPA-NI showed blistering in headspace + body damage

BPA/BPA-NI No H<sub>2</sub>S Production

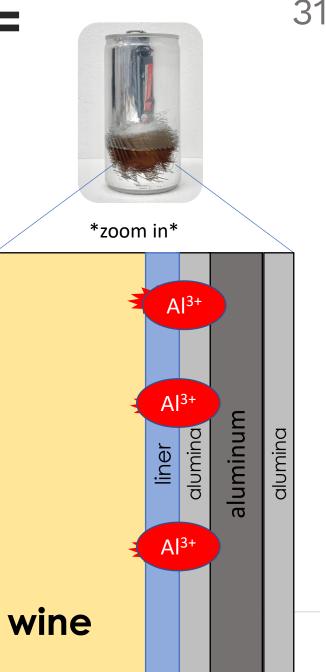

College of Agriculture and Life Sciences BPA/BPA-NI High H<sub>2</sub>S Producer

# Expectation: Visual degradation = dissolved Al<sup>3+</sup>

 Visible liner damage should lead to the exposure of bare aluminum

• This should result in dissolved aluminum:

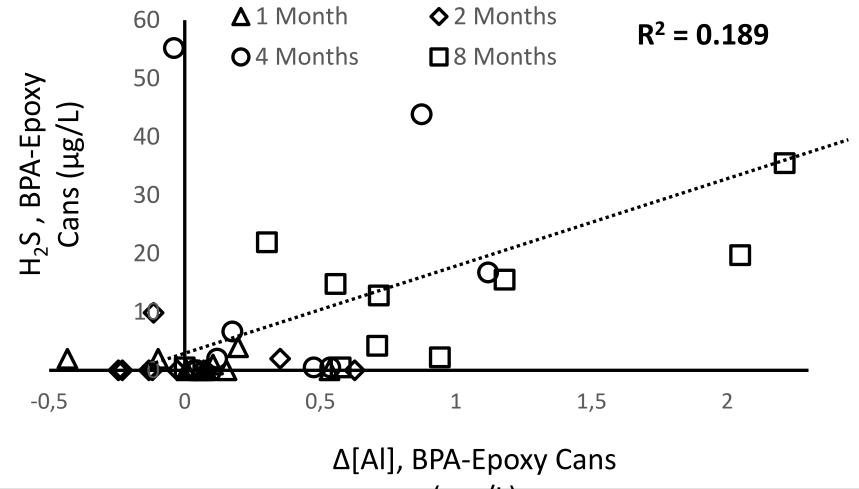

$$2Al^0_{(s)} + 6H^+ \to 2Al^{3+}_{(aq)} + 6H_{2(g)}$$

Cornel CALS College of Agricult and Life Sciences

# ... but Al<sup>3+</sup> is poorly correlated to H<sub>2</sub>S production

 Negligible Al<sup>3+</sup> signal until somewhere between 4 and 8 months.

(mg/L)

32

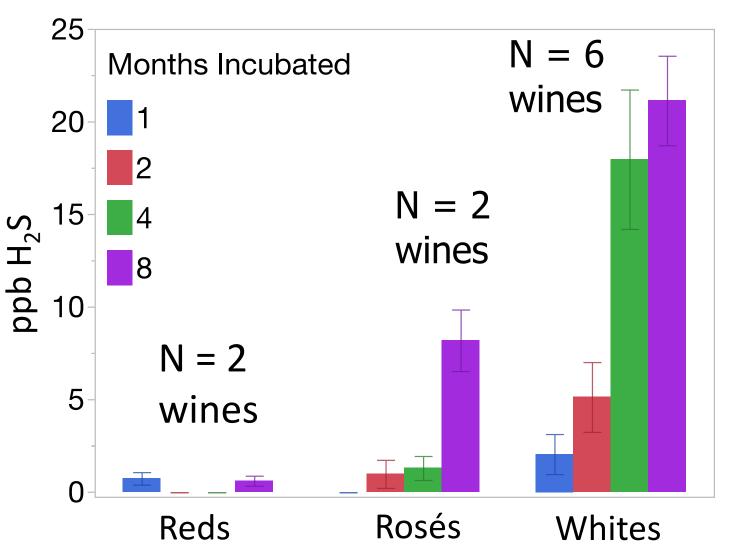

Montgomery and Allison, Goddard, Sacks. AJEV 2023

## Effect of wine type – long term aging

 Significant H<sub>2</sub>S formation can happen as soon as 4 months

CornellCALS

33

Acrylic samples excluded. Each point is n=3 reps

# **Chemical composition of wines studied**

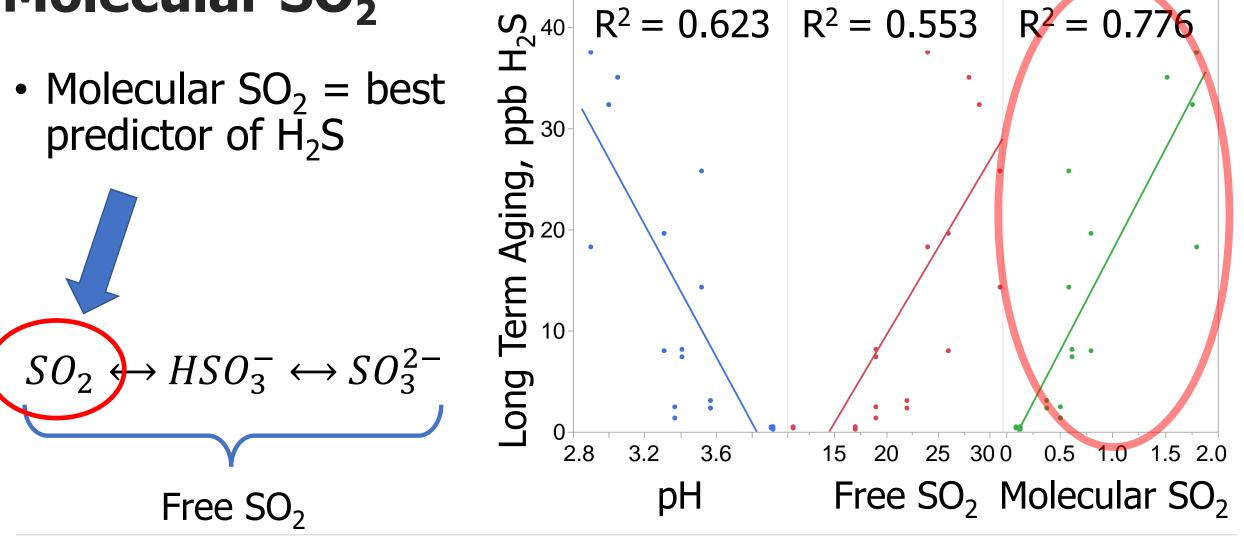

• Wines possessed typical table wine chemistry with these ranges:

34

Range	рН	TA	ABV	SO <sub>2</sub> mg/L			Sugar		
		g/L	v/v	Free	Total	Mol.	g/L	mg/L	mg/L
Low	2.9	5.5	8.6	11	36	0.1	0.9	0.05	32.1
High	3.9	9.1	13.2	31	142	1.8	65.33	0.39	442

### What best predicts $H_2S$ ? Molecular $SO_2$ $Q_2 = 0$

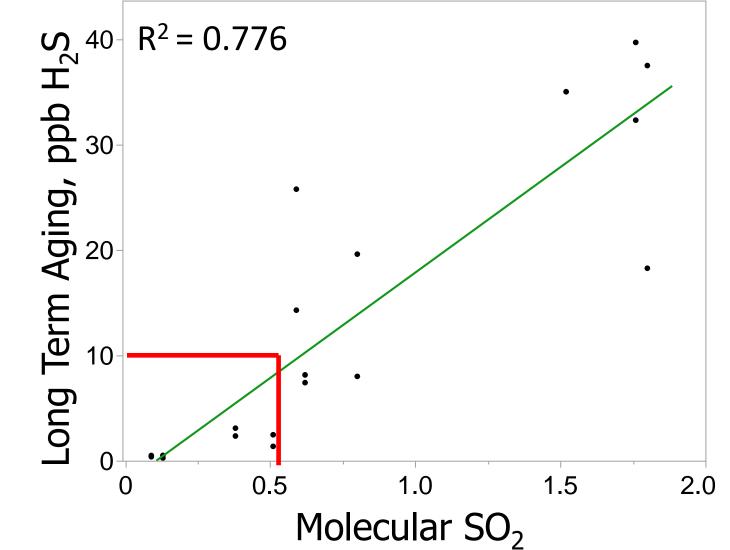

CornellCALS College of A and Life Scie Acrylic data excluded. Each point is Liner x Wine combo, n = 3.

#### What best predicts H<sub>2</sub>S? Molecular SO<sub>2</sub>

 Molecular SO<sub>2</sub> = best predictor of H<sub>2</sub>S

• ~ 0.5 ppm target Molecular SO<sub>2</sub>

Acrylic data excluded. Each point is Liner x Wine combo, n = 3.

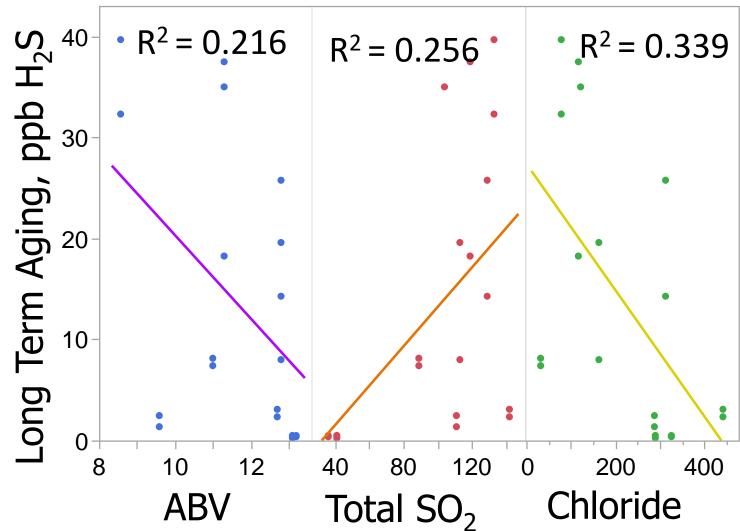

Cornell CALS College of Ag and Life Scie

### What best predicts H<sub>2</sub>S? Molecular SO<sub>2</sub>

• Molecular  $SO_2 = best$ predictor of  $H_2S$ 

- ~ 0.5 ppm target Molecular SO<sub>2</sub>
- ABV, Total SO<sub>2</sub>, Cl<sup>-</sup> uncorrelated

Cornell CALS

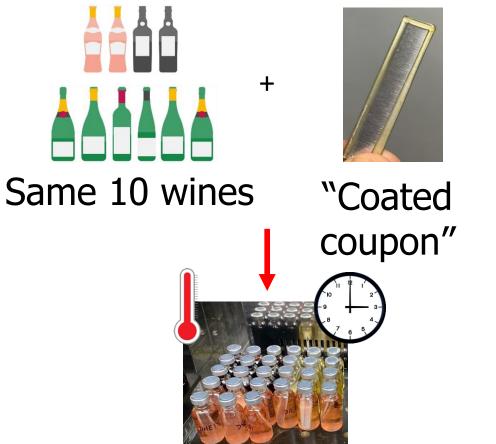

\*Cu < 0.1 mg/L most samples\*

37

Acrylic data excluded. Each point is Liner x Wine combo, n = 3.

#### Can accelerated aging conditions predict 38 H<sub>2</sub>S formation?

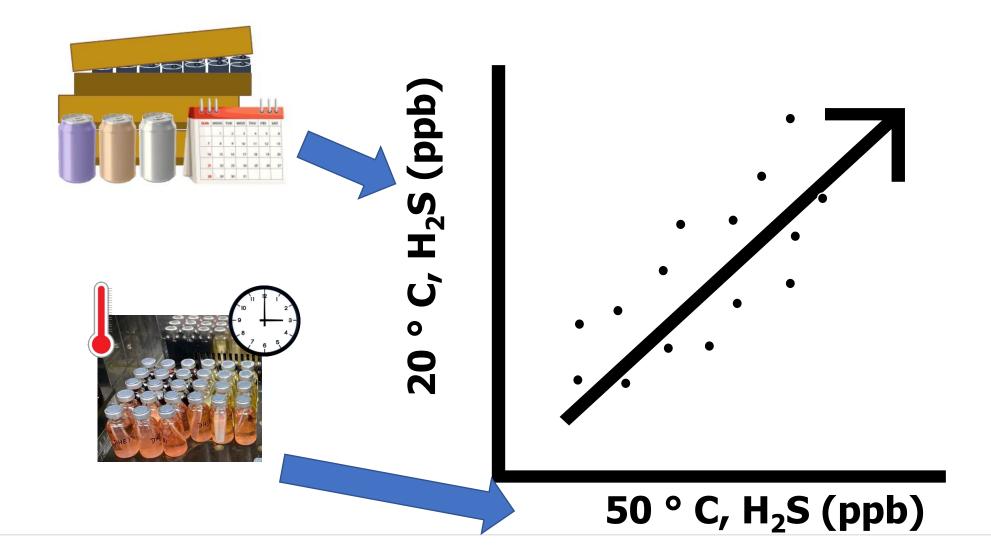

#### **Advantages**

- 1. Increase sample throughput
- 2. Save \$\$ on cost of materials
- 3. Measure model systems easily

#### Store in 27 mL glass vials at 50 $^{\circ}$ C, < 14 d

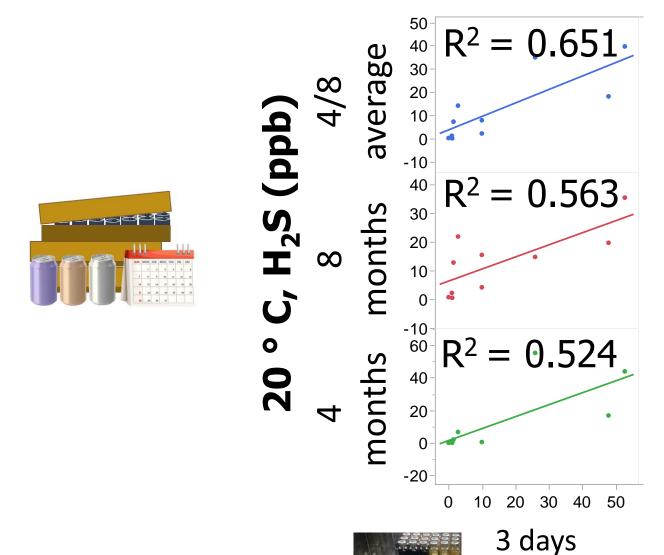

CornellCALS College of Agriculture and Life Sciences

#### How can we validate accelerated aging? <sup>39</sup>

CornellCALS College of Agriculture and Life Sciences

### **3 days 50 ° C predicts H<sub>2</sub>S formation well** 40

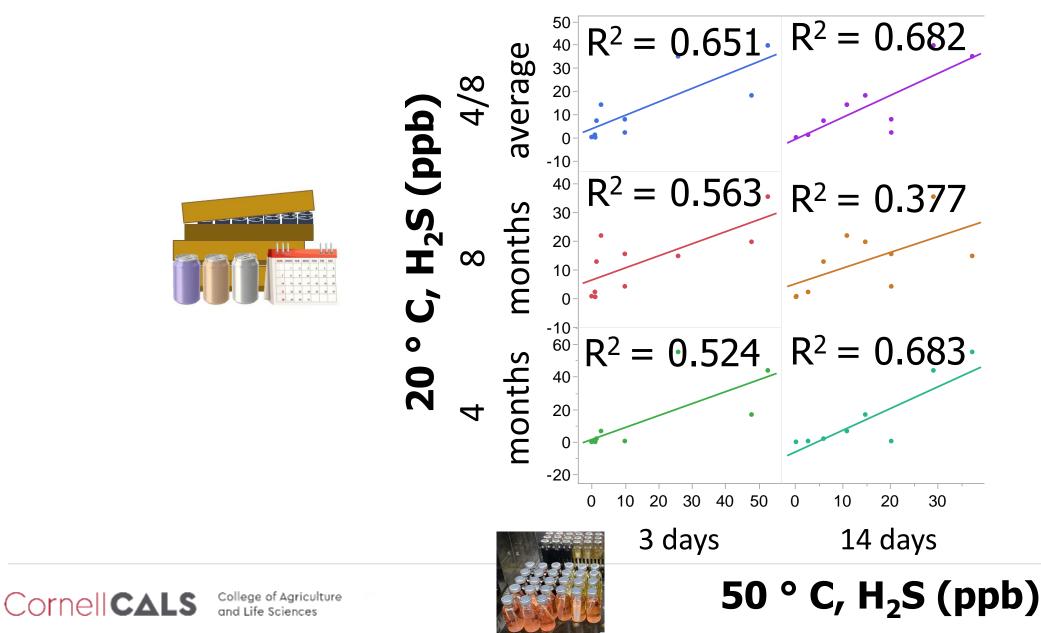

Cornell CALS

College of Agriculture and Life Sciences

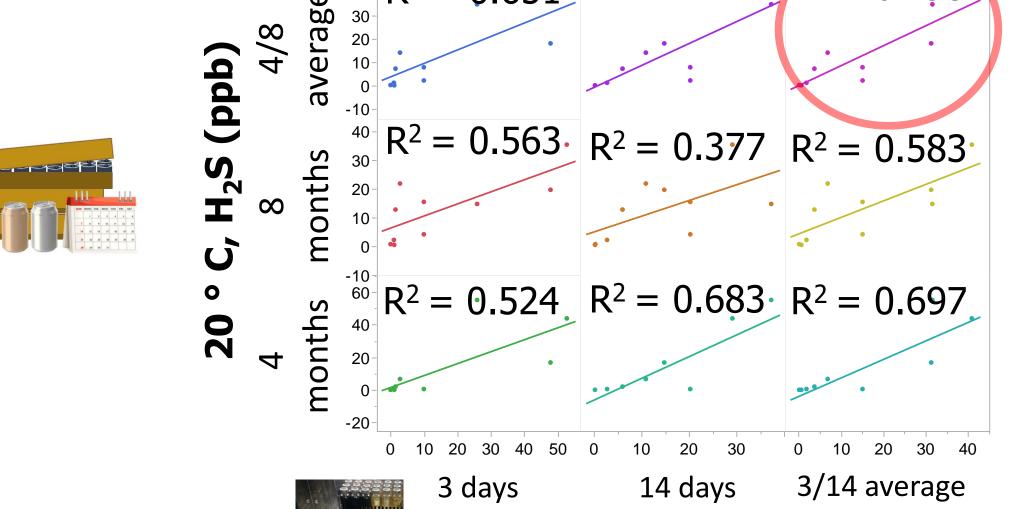

50 ° C, H<sub>2</sub>S (ppb)

## 14 days also predicts H<sub>2</sub>S formation well

## But, the average of 3 and 14 d predicts H<sub>2</sub>S best $R^2 = 0.651$ , $R^2 = 0.682$ , $R^2 = 0.793$ .

50 ° C, H<sub>2</sub>S (ppb)

42

Cornell CALS

College of Agriculture and Life Sciences

## Putting accelerated aging test to work

43

Now that we have a valid test, we can use it to address specific wine-systems!

College of Agriculture and Life Sciences

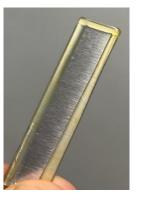

#### Putting accelerated aging test to work: role of ethanol

Non-alcoholic wines Red, Rosé, White

Ethanol, SO<sub>2</sub> Tartaric Acid

+ BPA-Epoxy Coupon

44

Challenge solutions with specific wine chemistry

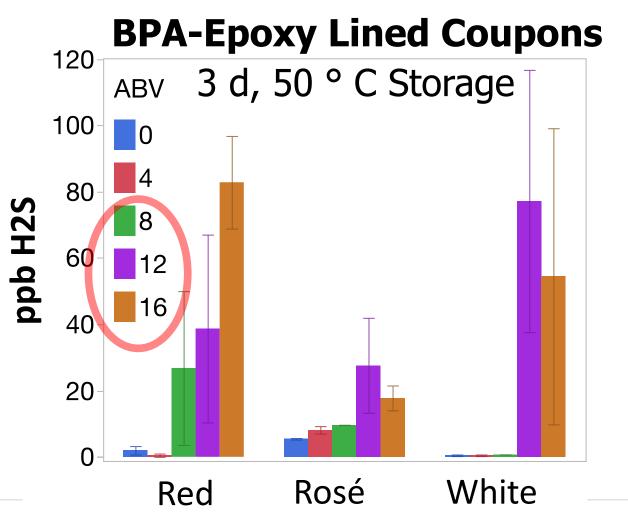

рН	3
Free SO <sub>2</sub>	50 ppm
EtOH	0, 4, 8, 12, 16 %

Cornelicals College of Agriculture and Life Sciences

# Putting accelerated aging test to work: role of ethanol

 ~8% ethanol "threshold" to observe H<sub>2</sub>S production

 Ethanol shows a weak effect over the range of typical table wines

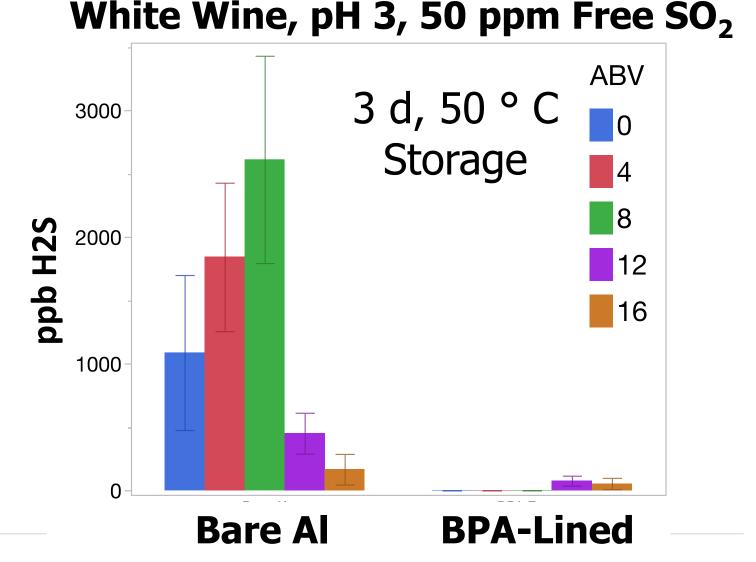

CornellCALS and

ollege of Agriculture nd Life Sciences N = 3 for each bar, error bars are standard error.

## **Bare aluminum – Poor Predictor of H<sub>2</sub>S**

 Bare aluminum shows opposite ABV effect, with a peak at 8%.

 Don't use bare aluminum as a metric for H<sub>2</sub>S potential!

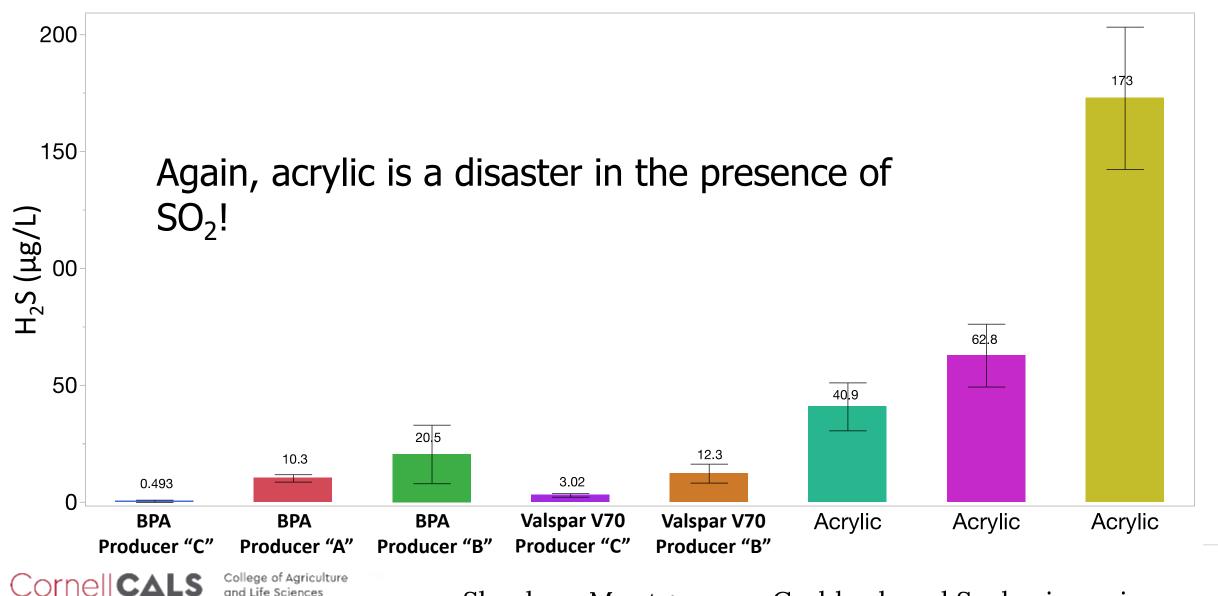

46

College of Agriculture and Life Sciences

N = 3 for each bar, error bars are standard error.

#### **Comparison of various liner performance**

Sheehan, Montgomery, Goddard, and Sacks, in review

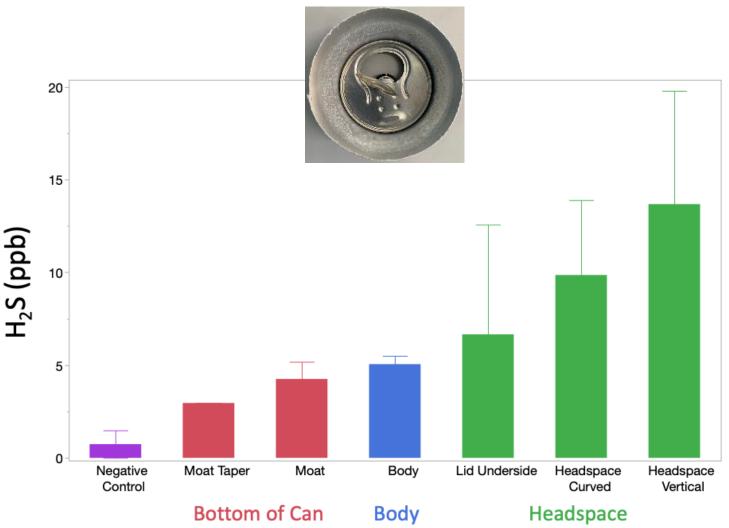

# Accelerated tests allow us to isolate parts of the can

 Highest and most variable corrosion is in the headspace!

• Further suggests that neutral, volatile acids are correlated with corrosion.

and Life Sciences

Cornell**CALS** 

48

Sheehan, Montgomery, Goddard, and Sacks, in review

### aTULC cans are a promising new liner

- aTULC cans are formed from extra thick PET-coated aluminum
  - More consistent application compared to spray on coatings.
  - Internal data (American Canning) suggests minimal scalping.

Cornelicals College of Agriculture and Life Sciences

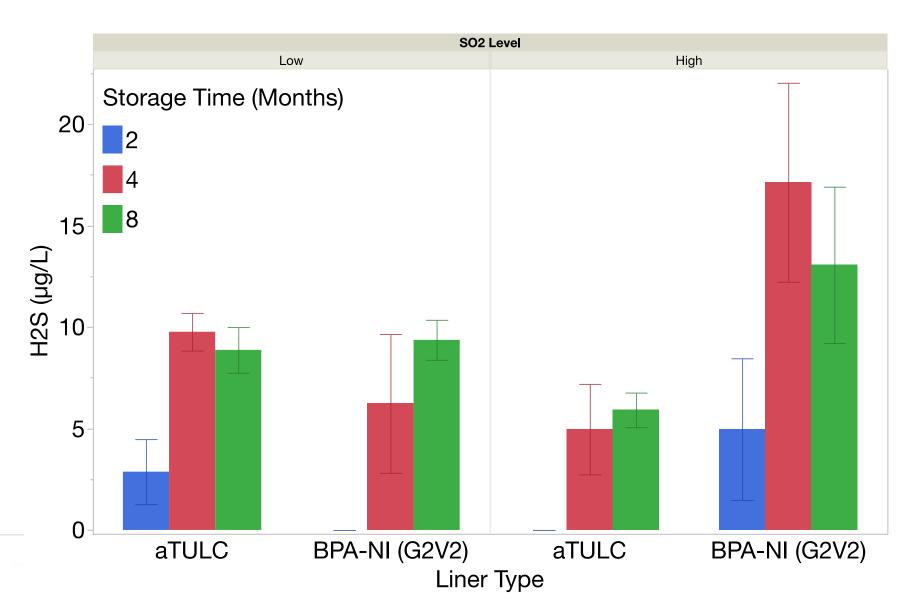

# Preliminary data suggests aTULC is good 50

 aTULC performed better than G2V2 at 4 and 8 months for a high SO<sub>2</sub> wine.

• Need more trials to confirm effect.

and Life Sciences

Cornell CALS

# For Wines/Ciders

- Keep molecular SO<sub>2</sub> under 0.5 mg/L.
  - If high residual sugar, in-bulk HPP and velcorin are options.
- Try to stay away from acrylic liners whenever possible BPA and BPA-NI are comparable in performance.
  - Get in contact w/ me if interested about accelerated aging protocol to test.
- Preliminary results suggest that aTULC is "good"!
  - More trials need to be conducted

Cornelicals College of Agriculture and Life Sciences

# **General Takeaways**

- When conducting shelf-life tests, the brand and type of liner matters!
  - Bare aluminum should not be used under any circumstance.
  - Producer A liner ≠ Producer B liner even if same polymer
- Be sure to use as many replicates as possible these systems are highly variable... yet one bad sample can ruin a whole pallet!
- We don't fully understand this system! We are currently working on finding new metrics that can predict corrosion more completely than simply  $AI^{3+}$  or  $H_2S$ .
